Course: CSCD 602 — Advanced Software Engineering, University of Ghana

Document: User_Manual.pdf · Version 1.0 · 14 August 2026

1. What Borla is

Borla connects households that have waste to dispose of with nearby collectors who are online and looking for work. There are two ways to get matched:

- **Broadcast** — tap "I HAVE WASTE" and every nearby online collector sees a pin on their map. Whoever gets there first collects it; you clear the pin the moment someone shows up.
- **Direct request** — pick one specific collector from the map and send them a request; they accept or reject it, and if they accept, you can both see and call each other.

Borla is a real installable web app (a PWA): after logging in, open **Profile** and tap **Install Borla app** to add it to your home screen with its own icon, launching full-screen like a native app (Chrome/Edge/Android; on iPhone, use Safari's Share → **Add to Home Screen** instead, since iOS doesn't offer the same in-app install button). When a new version is deployed, a banner appears at the bottom of the screen offering to **Update** — nothing changes under you without asking first.

2. Logging in (all roles) — one unified flow

There is a single entry point for everyone. You never have to say upfront whether you're a household, a collector, or an admin — **your phone number tells the app who you are**:

1. Open the app's URL (see `Deployment_and_Source_Links.txt`). You land on the welcome/splash screen — tap **Get started**.
2. Enter your phone number and tap **Continue**. That's the only field on this screen — no role picker, no "Admin" toggle to find.
3. What happens next depends on the number itself:
 - **It's a seeded admin's number** → you're taken straight to a password field ("This number is registered as an admin — sign in with your password"). Enter the password and tap **Sign in**. See §5 for the admin credentials.
 - **Anything else** → a one-time code is sent.
4. **If SMS delivery is configured and working**, a text arrives with your 6-digit code and the screen simply says "Code sent via SMS — check your phone."
5. **If SMS delivery isn't available** (no gateway configured, or the send failed), the screen shows the code directly in a dark banner labelled "SMS delivery unavailable right now" — this is a documented, deliberate fallback (see `Technical_Debt_Plan.md` TD-02), not a bug: nobody is ever locked out just because a text didn't arrive.
 - **Exception — the two seeded demo numbers** (`Deployment_and_Source_Links.txt`): since those numbers are arbitrary, not real handsets, they always use the same fixed code (**482913**) and the app never even attempts a real SMS send to them, so grading never depends on a text reaching a phone that doesn't exist. Any other, real phone number still gets a genuine random code.
6. Type the 6-digit code.
 - **Brand-new number** → the screen also asks "First time here — tell us a bit about you": pick **Household** or **Collector** and enter your name, then tap **Create account**.
 - **Number you've used before** → there's nothing else to fill in; tap **Verify & continue** and you're straight in.

3. Household walkthrough

Three tabs run across the top: **Home** (map + broadcast + nearby collectors), **My requests** (anything still active/in progress), and **History** (arrived, cancelled, rejected, or timed out — out of the way once there's nothing left to do).

1. **Home tab:** a map centred on your current location (allow location access when the browser asks), with green dots for nearby online collectors.
2. **To broadcast:** tap the big gold "🔔 **I HAVE WASTE**" button, optionally pick a waste type and add a short note, then **Confirm — I have waste**. A banner shows how many collectors were notified. The pin auto-expires after 45 minutes if you forget it.
3. **The moment someone comes for it:** tap **Clear pin** on the sticky banner — this removes it from every collector's map immediately, so nobody else wastes a trip.
4. **To request one specific collector:** scroll to "Nearby collectors," pick one, and tap **Request**. It shows up under **My requests** with a status chip: *Sent* → *Seen* → *On the way* → *Arrived*. If you've requested more than one collector at once, the list automatically re-orders itself **closest-first**, live, as each collector's actual route distance changes — not just once when the page loads.
5. **Changed your mind?** Tap **Cancel request** any time before the collector arrives — whether it's still awaiting a response or already accepted. Once the collector has arrived there's nothing left to cancel.
6. **Once accepted:** tap **Show contact** to reveal the collector's phone number and call them directly. A small map also appears showing the **route to your collector** with distance and an estimated time — a straight line if the routing service is briefly unreachable, a real road route otherwise. The map **zooms in as the collector gets closer** — wide while they're still crossing the neighbourhood, tight once they're at your gate. Tap the map to open it full-screen (dimmed background, tap the ✕ or anywhere outside the map to close it) for a better look.
7. **Arrival:** once the collector is right at your pickup point, *they* confirm it on their end with an **Arrived** button — you'll get an SMS ("Your Borla collector has arrived!") plus an in-app notification the moment they do, no need to refresh or ask. The request then moves to **History**.
8. **Reviews:** rate 1–5 and optionally comment, right there on the request card. It joins a **shared thread** with the collector's own rating — the moment either one clears moderation, *both of you* see it, at the same time, in the same place. Either side can then reply, as many times as you like, building a real back-and-forth (also moderated) instead of one capped reply. Nothing is held back waiting for the other person to review first — that's a deliberate change (see `Technical_Debt_Plan.md` TD-15) after early testers found the old "hidden until both sides reviewed" behaviour confusing (the same request looked different depending on who was looking at it). **Once a request is in History**, its map is gone (there's nothing left to navigate to) and the conversation itself is tucked behind a **"View conversation"** toggle rather than shown by default — tap it to read the full thread. It's frozen at that point: no new rating, no new reply, on either side.
9. **Profile tab:** adjust your alert radius and whether standing alerts are on; see your overall star rating and review count. Individual comments live on their request card, not here — Profile only shows the summary.

4. Collector walkthrough

Three tabs: **Home** (online toggle + map + nearby waste), **Requests** (incoming + on-the-way), and **History** (arrived, cancelled, rejected, or timed out).

1. **Home tab:** offline by default. The map here runs edge-to-edge (no side margins) so it feels like the main event rather than a small inset; once you're online, the **Go offline** button floats right on top of the map instead of sitting above it.
2. **New collector accounts start unverified** — you'll see a banner saying an admin must approve you before you can go online. This is a deliberate anti-abuse gate (only verified collectors ever receive broadcasts); ask an admin to verify your account (§5).

3. **Go online:** tap **Go online** (allow location access). Your position updates while the tab stays open in the foreground — this build has no native background-location service, so locking your phone or switching apps pauses updates (documented in `Technical_Debt_Plan.md` TD-O3; keep the tab open and the screen on while actively collecting).
4. **Nearby waste:** active pins appear on your map and in the list below it, closest first, with a one-tap  **Call** button.
5. **Requests tab:** incoming direct requests appear as a card with **Accept/Reject**. Accepting reveals the household's phone number to both of you and moves it into "On the way," with a small map showing the **route to that household** (distance + estimated time), zooming in as you close the gap. If you have more than one on the way, they sort **closest-first**, live, as you move. Tap any route map to open it full-screen for a clearer look, with a dimmed background and a close button.
6. **Cancel** is available on anything you've accepted but haven't reached yet — use it if you're no longer able to make the pickup.
7. **Arrival is a button, not automatic:** once your live position is close enough to the household's pickup point (the **arrival radius**, tuned by an admin in §5), an **Arrived** button appears on the request card. Tap it to confirm — the server double-checks you're actually within range before accepting the tap (your device claiming it isn't enough on its own), then texts the household ("Your Borla collector has arrived!") and notifies both of you in real time. The request then moves to **History**.
8. **History:** once a request is resolved, its map disappears and the review thread is hidden behind a **"View conversation"** toggle instead of showing by default; tap it to read (or leave/reply to) the review — though once there, the thread is frozen read-only, so any rating or reply needs to happen before the card leaves the active list.
9. **Go offline** when you're done — this immediately removes you from the matchable set.

5. Admin walkthrough

1. At the sign-in screen, enter the admin's phone number and tap **Continue** — there is no separate admin toggle to find; the app recognises the number and shows a password field instead of sending an OTP ("This number is registered as an admin — sign in with your password").
2. Enter the password (see `Deployment_and_Source_Links.txt` for the seeded demo admin credentials) and tap **Sign in**.
3. You land on **Admin — Ops console** with six tabs:
 - **Stats:** online collectors, users by role, broadcasts/requests by status, moderation backlog.
 - **Map:** live view of active pins (gold) and online collectors (green).
 - **Users:** search, **Verify** a collector (required before they can go online), or **Suspend/Reinstate** any account.
 - **Moderation:** AI-flagged/user-reported items to **Clear** or **Remove**, plus anything still awaiting moderation entirely (shown here whenever no `GEMINI_API_KEY` is configured) with a one-click **Approve**.
 - **Audit:** every privileged action taken by any admin, with a timestamp.
 - **Config:** live-editable operational settings (pin TTL, broadcast radius, request timeout, notification cap, arrival radius — how close a collector's live position must get to the pickup point before the Arrived button appears) — changes apply immediately, no redeploy.

6. Redeploying / rolling back

The app auto-builds from the `main` branch of the connected GitHub repository. To ship a change: push to `main`; Render rebuilds and redeploys automatically. To roll back: in the Render dashboard, open the service → **Events/Deploys** tab → pick an earlier successful deploy → **Redeploy**. Database migrations run automatically on server boot (`server/src/db/migrate.ts`) and are additive/idempotent — rolling the *app* back does not roll the

schema back, so avoid rolling back past a deploy that introduced a schema change unless you also revert `server/migrations/`.

7. Troubleshooting

Symptom	Likely cause	Fix
"Your collector account is not verified yet"	New collector account, not yet admin-approved	Log in as admin → Users → Verify
No collectors/pins showing on the map	Location permission denied, or nobody online nearby	Allow location access; try again once a collector/household is nearby in the seed data
OTP screen shows the code instead of "sent via SMS"	SMS gateway not configured or the send failed	Expected fallback — use the shown code; see <code>Technical_Debt_Plan.md</code> TD-02
A review you wrote never shows up	Still awaiting moderation	It joins the shared thread on that request card the moment it clears — there's no waiting on the other person any more. An admin can check Admin → Moderation if it seems stuck
Build fails on Render with "vite: not found"	<code>NODE_ENV=production</code> made <code>npm ci</code> skip devDependencies	Already fixed in <code>render.yaml</code> (<code>--include=dev</code> on the build command)
